Inserting figures and evaluated examples

Georgi N. Boshnakov

Abstract

Package **lagged** provides classes and methods for objects, whose indexing naturally starts from zero.

This vignette is part of package lagged, version 0.1-2.

Keywords: lag, autocorrelation, indexing.

1. Univariate lagged objects

Create a univariate lagged object¹:

```
> a1 <- drop(acf(ldeaths)$acf)
> la1 <- Lagged(a1)
> la1
An object of class "Lagged1d"
Slot *data*:
       Lag_0
                                 Lag_2
                                               Lag_3
                    Lag_1
                                                            Lag_4
                                                                          Lag_5
 1.000000000
              0.755051141
                           0.396956836
                                         0.019395714 -0.355897989 -0.608566374
       Lag_6
                    Lag_7
                                 Lag_8
                                               Lag_9
                                                           Lag_10
                                                                         Lag_11
-0.681383469 -0.607909875 -0.378212377 -0.012975866
                                                     0.383252644
                                                                   0.650206704
      Lag_12
                   Lag_13
                                 Lag_14
                                              Lag_15
                                                           Lag_16
                                                                         Lag_17
 0.723167071
                           0.371577811 0.009467461 -0.293699737 -0.496742216
              0.638001465
      Lag_18
-0.585558984
```

maxLag() returns the maximal lag in the object. Length() returns the number of lags in the object,
i.e. length(la1) == maxLag(la1) + 1. This relation is a definition and holds also for multivariate
lagged objects. In particular, the length is not necessarily the length of the data slot.

```
> maxLag(la1)
[1] 18
> length(la1)
[1] 19
```

2. Indexing

¹The datasets ldeaths, fdeaths and mdeaths are in base R. The examples involving them are adapted from the help page of acf().

Indexing drops the "laggedness" to allow easy access to the underlying data²:

```
> la1[0]
[1] 1
> la1[0:4]
     1.00000000 \quad 0.75505114 \quad 0.39695684 \quad 0.01939571 \quad -0.35589799
> la1[c(1,3,5)]
[1] 0.75505114 0.01939571 -0.60856637
> la1[]
 [1]
    1.000000000 0.755051141 0.396956836 0.019395714 -0.355897989
 [6] -0.608566374 -0.681383469 -0.607909875 -0.378212377 -0.012975866
[11] 0.383252644 0.650206704 0.723167071 0.638001465 0.371577811
[16] 0.009467461 -0.293699737 -0.496742216 -0.585558984
> la1a <- la1
> la1a[] <- round(la1, 2)
> la1a
An object of class "Lagged1d"
Slot *data*:
Lag_0 Lag_1 Lag_2 Lag_3 Lag_4 Lag_5 Lag_6 Lag_7 Lag_8 Lag_9 Lag_10
                0.40
                       0.02 -0.36 -0.61 -0.68 -0.61
                                                         -0.38 -0.01
                                                                         0.38
Lag_11 Lag_12 Lag_13 Lag_14 Lag_15 Lag_16 Lag_17 Lag_18
  0.65
         0.72
                0.64
                       0.37
                              0.01 -0.29 -0.50 -0.59
> la1b <- round(la1, 2)
> all(la1a == la1b)
[1] TRUE
```

3. Unary arithmetic and mathematical functions

Unary arithmetic operations and mathematical functions replace the data part of the object and keep its class.

```
> -la1a
An object of class "Lagged1d"
Slot *data*:
Lag_0 Lag_1 Lag_2 Lag_3 Lag_4 Lag_5 Lag_6 Lag_7
                                                        Lag_8 Lag_9 Lag_10
 -1.00 -0.76 -0.40 -0.02
                             0.36
                                           0.68
                                                         0.38
                                                                0.01 - 0.38
                                    0.61
                                                  0.61
Lag_11 Lag_12 Lag_13 Lag_14 Lag_15 Lag_16 Lag_17 Lag_18
       -0.72
 -0.65
              -0.64
                     -0.37
                            -0.01
                                    0.29
                                           0.50
                                                  0.59
```

²For some indices, such as 0:4, it is possible to keep a Lagged class but it would be confusing if the indexing operation was returning Lagged or non-Lagged objects depending on the values of the index.

```
> +la1a
```

```
An object of class "Lagged1d"
Slot *data*:
Lag_0 Lag_1 Lag_2 Lag_3 Lag_4 Lag_5 Lag_6 Lag_7 Lag_8 Lag_9 Lag_10
  1.00 \quad 0.76 \quad 0.40 \quad 0.02 \quad -0.36 \quad -0.61 \quad -0.68 \quad -0.61 \quad -0.38 \quad -0.01 \quad 0.38

```

Binary arithmetic operators are defined between two lagged objects and between a lagged object and a vector. They return a lagged object from one of the "basic" lagged classes, but not necessarilly exactly from the class of the argument(s). The class of the returned value is from a suitable lagged superclass of the argument(s). This concerns operations on objects from classes inheriting from the classes considered here, so is not visible in the examples below, since they use objects from the basic lagged classes.

```

There is a case to argue for keeping the class in some situations, e.g. when the other argument is a scalar but eventually I decided to keep the simple rule of not trying to preserve the class.

Note however that unary operators and mathematical functions do preserve the class.

4. Multivariate lagged objects

Compute the autocorrelations of a multivariate time series and convert it to a lagged object.

Indexing in acf() is somewhat misterious. For some insight, here is a comparison with a DIY calculation of the autocorrelations.

```
> n <- length(mdeaths)
> tmpcov <- sum((mdeaths - mean(mdeaths)) * (fdeaths - mean(fdeaths)) ) / n
> msd <- sqrt(sum((mdeaths - mean(mdeaths))^2)/n)</pre>
> fsd <- sqrt(sum((fdeaths - mean(fdeaths))^2)/n)</pre>
> tmpcov1 <- sum((mdeaths - mean(mdeaths))[2:n] * (fdeaths - mean(fdeaths))[1:(n-1)] ) / n
> tmpcov1 / (msd * fsd)
[1] 0.7356685
> la2[[1]][1,2] == tmpcov1 / (msd * fsd) # FALSE, but:
[1] FALSE
> la2[[1]][1,2] - tmpcov1 / (msd * fsd) # only numerically different
[1] 2.220446e-16
Some examples for the correspondence between the indices in lagged objects and those from acf().
> la2[[1]][1,2] == acv2$acf[2, 1, 2] # TRUE
[1] TRUE
> la2[0]
, , 1
          [,1]
                   [,2]
